Fall Documentation

Category	Exceeds Expectations (90-100%)	Meets Expectations (60-89%)	Below Expectations (0-60%)
Length	>=2100 words		<2100 words
Design (50%)	Solution design is clear and reasonable. Documents major choices in solution design - what technologies are used and why. Decisions are reasonable for a senior computing student.	Solution design works, but is flawed in some meaningful ways. May not sufficiently document reasoning behind major choices.	Solution design has major flaws.
Evaluation (20%)	There is a clear and reasonable process for evaluating your solution that has been regularly applied, with results included in the documentation.	There is a clear and reasonable process for evaluating your solution, but it has not been regularly applied, or the results are not regularly documented.	There is not a clear and reasonable process for evaluating your solution, or results are not sufficiently documented.
New Knowledge (10%)	Documentation clearly describes new technologies learned or skills developed while working on the project. It describes how you learned/developed in these areas and includes a list of helpful tutorials used.	Documentation mentions new technologies learned or skills developed while working on the project, but only briefly or in a way that would be difficult for a newcomer to recreate.	Documentation does not sufficiently describe new tecnologies learned or skills developed while working on the project.
Communication (20%)	Writing is aimed at appropriate level - a new computing senior design team could recreate this solution and expand on it next year.	Documentation sufficiently covers the project, but has moderate issues (may not be thorough enough to recreate and expand on project, or may be written to too niche of an audience)	Documentation is insufficient for a typical senior computing student to understand or begin to recreate the project.
